

INFORMATION SHEET PONTOON INSPECTIONS

Key factors:

- Minimal traffic disruption
- Access to within touching distance
- Day time working
- Minimal cost
- Lightweight modular system, units 15kg each
- Stable and high buoyancy factor
- Easily transported and erected
- Easily manoeuvred
- Various height and platform base options available

The Up and Under Group have pioneered an access system for working above water that can remove the need for expensive underbridge access platforms, traffic management, night working and interruption to the journey time of the general public, whilst still allowing inspections to within touching distance.

The lightweight modular system easily connects together to give a stable floating platform of varying sizes. With the addition of handrails and a tower scaffold the system has the flexibility to access a wide range of structures.

The systems has been proven on:

- Canals - without scaffold for low headroom structures
- Large river spans with scaffold to reach deck
- Short span structures where access plant cannot reach
- Highway structures
- Rail structures
- Inside partially flooded, enclosed, balancing tanks
- During culvert repair works
- Lakes and reservoirs
